SEX  
FEMALE

**DEXA BONE DENSITOMETRY**

History: Bone density diagnostic testing. Osteoporosis. Comparison: COX, 2010

*RECORDED  
2-16-2013*

Technique: The bone densities of the lumbar spine and left femoral neck were determined using dual energy x-ray absorptiometry scanning (DEXA)

Lumbar spine: Current 2013 BMD (L2 - L4) is 0.908 g/cm<sup>2</sup> yielding T = -2.4 *IMPROVED*  
Previous 2010 BMD (L2 - L4) is (mg) g/cm<sup>2</sup> yielding T = -3.4

Left total hip: Current 2013 BMD is 0.948 g/cm<sup>2</sup> yielding T = -2.0 *SAME*  
Previous 2010 BMD is (mg) g/cm<sup>2</sup> yielding T = -2.0

Left femoral neck: Current 2013 BMD is 0.948 g/cm<sup>2</sup> yielding T = -3.6 *WORSE*  
Previous 2010 BMD is (mg) g/cm<sup>2</sup> yielding T = -3.1

*LUMBAR SPINE IS  
BETTER  
LEFT HIP SAME  
LEFT FEMORAL  
NECK IS  
WORSE  
W.F.*

**IMPRESSION:**

- The bone mineral density of the lumbar spine is considered osteopenic.
- The bone mineral density of the left total hip is considered osteopenic.
- The bone mineral density of the left femoral neck is considered osteoporotic.

- BMD is bone mineral density.
- T score indicates the number of standard deviations of the patient BMD from the young adult matched value.
- A T score of -2.0 is considered osteopenic.
- A T score of -1.0 to -2.4 is considered osteopenic.
- Each standard deviation (T) of bone loss results in a three-fold increase in fracture risk.
